Fuelize MDU — Version Document

Project Overview

Fuelize MDU is the Android tablet application that controls the fuel dispenser during a delivery. It receives an order from the Fuelize Driver App, authorizes the requested quantity on the dispenser over an RS-485 serial link using the Tokheim UDC protocol, monitors fuelling through to completion, reads the pump totalizers, and reports the delivered quantity back to the Driver App. This build targets Tokheim dispensers specifically.

Platform	Android (min SDK 28, target SDK 34)
Package	com.fuelize.code
Dispenser	Tokheim — UDC protocol over RS-485 (9600 8N1)
Role	In-field dispensing controller (MDU)
Current	Version 2.12 (build 2)

Version History

Version	Build	Date	Changes
2.12	2	27 Oct 2026	• Fixed dispensing stopping immediately on nozzle lift (slow-pump premature completion). • Added persistent on-device file logging (daily file, size rollover, crash capture, tagged lines). • Removed on-screen diagnostic panel. • Updated visible labels from “Eastman” to “Tokheim” (Tokheim-specific build).
2.11	1	03 Mar 2026	Previous release. Detailed change log not maintained prior to 2.12.

Generated 27 Oct 2026.
